DATA MIGRATION & SYSTEM TRANSITION

Bulk Products & Customer Credit CSV Migration Guide

Complete technical specification for importing existing inventory catalogs, pricing tiers, dual-location stock positions, and customer credit ledger balances into Nexus ERP.

CLASSIFICATION	Data Migration	RELEASE VERSION	v2.4.0 (Enterprise)
AUTHOR / TEAM	Nexus Database Services	EFFECTIVE DATE	October 2026
TARGET AUDIENCE	Accountants, Database Administrators, Migration Consultants	STATUS	Official Production Ready

1. Migration Overview & Data Cleansing

Migrating historical data from legacy software (QuickBooks, Tally, Excel, or custom POS databases) into Nexus ERP requires strict adhering to column naming conventions and data types. This guide provides the exact schemas required for seamless CSV ingestion.

2. Products Master Catalog CSV Schema

The inventory catalog template accepts both single-store products and multi-branch allocations. Save file as `UTF-8 CSV (Comma Delimited)`:

Column Header	Type	Required?	Validation Rules	Example Value
`item_code`	String	YES (Unique)	Alphanumeric, no spaces	`SKU-10024`
`barcode`	String	Optional	EAN-13, UPC, Code 128	`4792001002451`
`product_name`	String	YES	Full description (max 255 chars)	`Sunlight Soap 100g Pack`
`category`	String	YES	Existing or new category name	`Personal Care`
`cost_price`	Decimal	YES	Standard unit cost (positive)	`85.00`
`selling_price`	Decimal	YES	Standard retail price	`110.00`
`wholesale_price`	Decimal	Optional	Discounted bulk tier	`98.00`
`opening_stock`	Integer	YES	Initial count (0 if out of stock)	`150`
`reorder_level`	Integer	YES	Threshold for low-stock alerts	`25`

Critical Encoding Directive: UTF-8 Without BOM

Always ensure your CSV file is exported from Excel using 'CSV UTF-8 (Comma delimited) (*.csv)'. Standard ANSI export will corrupt non-English characters (such as Sinhala or Tamil product descriptions) and introduce header byte order marks (BOM) that cause header parse failures.

3. Customer Credit & Opening Balance Schema

To preserve trade customer accounts receivable and credit history, import existing clients using the Customer Credit Master format:

Field Name	Type	Required?	Purpose & Business Logic	Example
`customer_name`	String	YES	Full registered customer / trade name	`Lanka Traders Ltd`
`phone_number`	String	YES	Unique contact number (10 digits)	`0771234567`
`nic_or_br`	String	Optional	NIC or Business Registration number	`PV123456`
`credit_limit`	Decimal	YES	Max credit allowance (LKR)	`250000.00`
`credit_period_days`	Integer	YES	Payment terms (e.g. 30 days)	`30`
`opening_balance`	Decimal	YES	Existing outstanding debt owed	`45200.00`

4. Ingestion Execution & Error Quarantine

Nexus ERP includes automated schema validation before any records touch the production database:

1. **Pre-validation:** The system scans all rows for duplicate barcodes or missing mandatory values.
2. **Error Quarantine Table:** Invalid rows are isolated into an error download file specifying the exact row number and failure cause (e.g., `Row 42: Duplicate Barcode 4791002`).
3. **Atomic Commit:** Valid products are committed to the inventory database in bulk batches of 500 records.

5. Post-Migration Verification & Rollback Safeguards

Immediately upon completing bulk migration, perform the following verification routines:

[✓] Confirm total inventory asset value in **Reports** → **Stock Valuation** matches your opening balance sheet.
[✓] Verify that total accounts receivable in **Customer Ledger Summary** matches previous software.
[✓] Execute a test barcode scan on 5 random products at POS checkout to verify pricing accuracy.

One-Click Import Rollback Window

Nexus ERP provides a 2-hour rollback window after every CSV import batch. If erroneous prices or quantities were uploaded, navigate to Settings → Import History and click 'Rollback Batch' to reverse all changes cleanly.
